

WoO Approach General Overview

WF-IoT 2014

Mihaela Brut, Patrick Gatellier
Thales Services, France

Ilyoung Chong,
Hankuk University of Foreign Studies, Korea

Scientific and Business Context

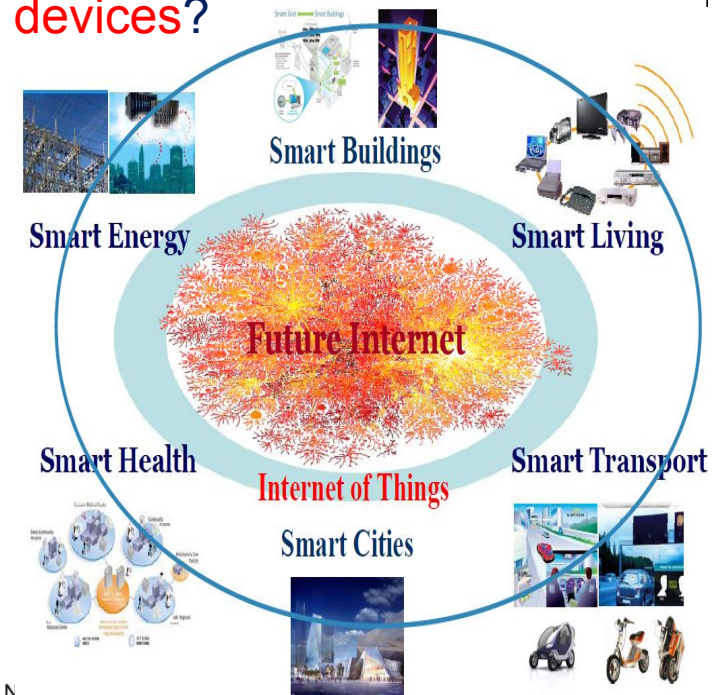

IoT boom:

- ◆ Since 2007: more devices than people are connected to Internet ([Cisco IoT IBSG, 2011](#))
 - ◆ In 2020: 50 billions devices will be connected to Internet ([Ericson, 2010](#))
 - ◆ In 2020: the global M2M business (large industry, solution providers, connectivity providers) will reach 260 milliards Euros ([Machina Research, 2012](#));
 - ◆ By 2020: IoT will add \$1,9 trillion to the global economy ([Gartner, 2013](#))
- => huge business application development (**WoT & Future Internet boom**)

People connected to Internet resulted in Web 1.0, 2.0, 3.0 ... applications

What can we imagine about the future of the connected devices?

Huge deployment of smart devices and sensors, resulting in huge amount of data collected, not exploited in real-time, nor outside a closed system:

- ◆ **Smart metering => filtered data is selected for billing purposes, and various statistic analysis are accomplished**
 - If a third party (e.g. insurance company) is interested in specific data, no legal framework and no technical support
- ◆ **Smart homes:** each equipment is able to switch in secure mode, and to send information or alarm messages, eventually to receive remote control commands
 - France: government investment in “sensing” the elder people homes

Example of « Sensor Map » type platforms:

- ◆ Citysense (by Sense Networks): <http://www.citysense.net/>
 - ◆ Sensor Map (by Microsoft): <http://atom.research.microsoft.com/sensewebv3/sensormap/>
 - ◆ QEO (by Technicolor) <http://www.i-speak-qeo.com/events.php>
- Integrated solutions requiring that the proprietary bricks are adopted by all parties: service providers, device providers, application developers
- involve **network connectivity providers**, such as the SIGFOX dedicated M2M/IoT network: btw objects, **SL Internet**

Arduino electronics prototyping platform (<http://www.arduino.cc/>)

- ◆ A board with a microcontroller , that could be programmed using the Arduino programming language and the Arduino development environment: free software available
- ◆ receives input from a variety of sensors and can control lights, motors, and other actuators
- ◆ can be stand-alone or they can communicate with software running on a computer (e.g. Flash, Processing, MaxMSP).

Phidgets - <http://www.phidgets.com/>

- ◆ A box (in various assembling formulas) connecting USB sensors & devices to be controlled from a PC
- ◆ Applications for controlling devices could be quickly developed in various languages based on the provided **APIs**

Sense Mother, with **Motion Cookies** for connecting every day objects

!!! The Internet and Web aspects are not considered

Ninja Block and **Twine**: sensor box connected and controlled via Web

Device producers adopt proprietary solutions:

Siemens

- ◆ <https://www.siemens.be/cmc/ccmi/smarthome/fr/particulier/>

Schneider

- ◆ <http://www.schneider-electric.com/products/ww/en/>

Some specific APIs are provided to public:

Philips Hue API: intelligent lighting

- ◆ together with this **API**, Philips provided a **software development kit (SDK) for iOS developers** who want to make their own mobile apps to turn off, dim, time or sync their Hue bulbs
- ◆ communication between the device (light bulb) and iPhone is done via the ZigBee Light Link low-power wireless protocol.
- ◆ Application examples:
 - app that syncs the light bulbs with music
 - app that uses the iPhone's calendar to schedule when the lights should be on
- ◆ See

<http://iotevent.eu/philips-offers-ios-sdk-for-hue-the-connected-lightbulb->

Allseen Alliance - <https://allseenalliance.org/>

- ◆ the broadest cross-consortium to advance the adoption and innovation in the “**Internet of Everything**” in homes and industry
 - ◆ The idea: devices, objects and systems can be **connected** in simple, transparent way to enable seamless **sharing of information** and coordinated and intelligent **operations across all of them**
 - ◆ Devices and services become able to discover, connect and interact
 - ◆ Pave the way to consumer oriented applications development
 - ◆ Initial framework is based on [AllJoyn](#) open source project
 - the products, applications and services created with AllJoyn can communicate over multiple transport layers (Wi-Fi, power line or Ethernet) regardless the manufacturer or operating system and without the need for Internet access
 - Versions available for Linux, Android, iOS and Windows
- ⇒ Adoption of **open-source** as fundamental approach

WoO Project Focus at a Glance

WoO focus: building application layer over the IoT infrastructure

⇒ Providing support to business players to involve heterogeneous objects in complex applications for improving our quality of life

Ex 01: incident management

- ◆ real-time alarm processing leading to stakeholders coordination could **save lives and resources**
- ◆ **Objects are active players:** cameras turns to the scene and notifies security agent, door closes, electrical equipment asks for being rescued, water plug notify its presence to fireman, etc;

CC-Video-Tracker:
 -suspectSelection
 -suspectLocalization

CC-Alarm-Manager:
 -callFireAgency
 -assignRightsFireman
 -evacuationMessage

CC-Maintenance:
 -equipmentFaultDetection
 -assignRightsRepairman

Ex 02: communicate with the environmental objects

- ◆ Instead having a lot of “cards” that duplicate your profile
- ◆ Use your NFC-enhanced Smartphone for communicate with: your home, your car, mall parking, restaurants or shops

Ex 03: climate control and energy saving

- ◆ By exploiting occupancy information in building

Ex 04: smart emergency services

- ◆ Multiple types of objects in Home and Shopping Mall collaborate to provide customer-centered emergency service capabilities through **semantic ontology** and **context awareness** mechanism
- ◆ Dynamic creation of device/user community for **customer-centric service features** (e.g., for normal persons, handicapped persons, children, etc.)

Semantics is a key enabler for a common language such as:

- ◆ A device (belonging to a particular or to a institution) is **accessible and** to third parties applications (government, police, fire agency, hospitals, shops, restaurants)
- ◆ A complex application for smart city **integrate as actors devices** from multiple stakeholders

Service composition is a strong requirement since:

- ◆ Complex business applications are based on complex service workflows

Interoperability

- ◆ The number and diversity of communication protocols between these devices are for any industrial system a real Babel tower

Security is a strong requirement since:

- ◆ Exposing a device on the Internet increase its security vulnerability

Better exploiting the Smartphone Sensors

- ◆ Gloo platform: Integrating the smartphone capabilities in the Web of Things

Standardization efforts was seriously considered:

- ◆ IoT solution can be adopted by Business world if based on standards

WoO Project Structure

- 25 Partners:

- Large companies (6)
- SMEs (7)
- Universities (7)
- Research institutes (5)

The main project result:

service infrastructure for IoT business applications

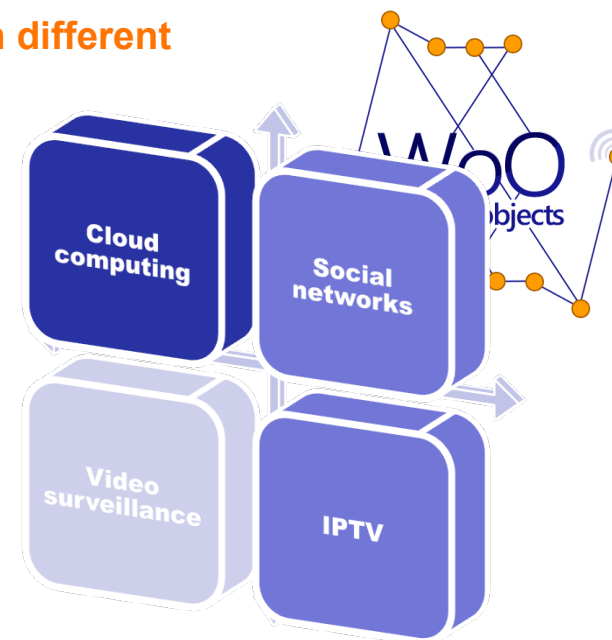

based on standardized protocols
enabling:

- Multi-tenancy of devices & services
- interoperability sensor services,
- service discovery and composition,
- dynamic configuration

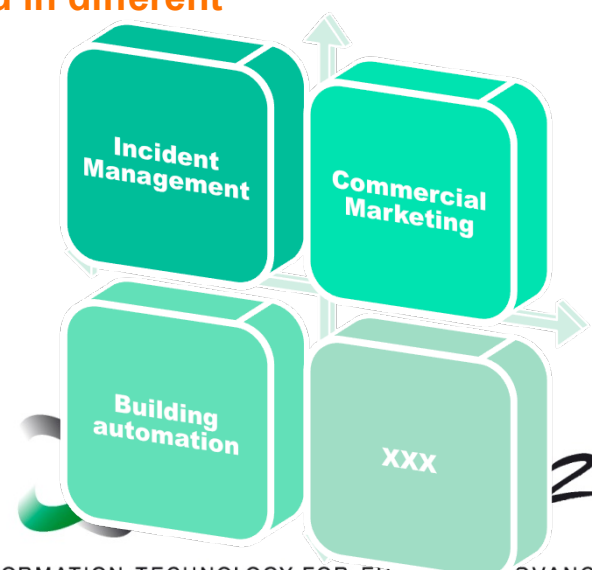

and including:

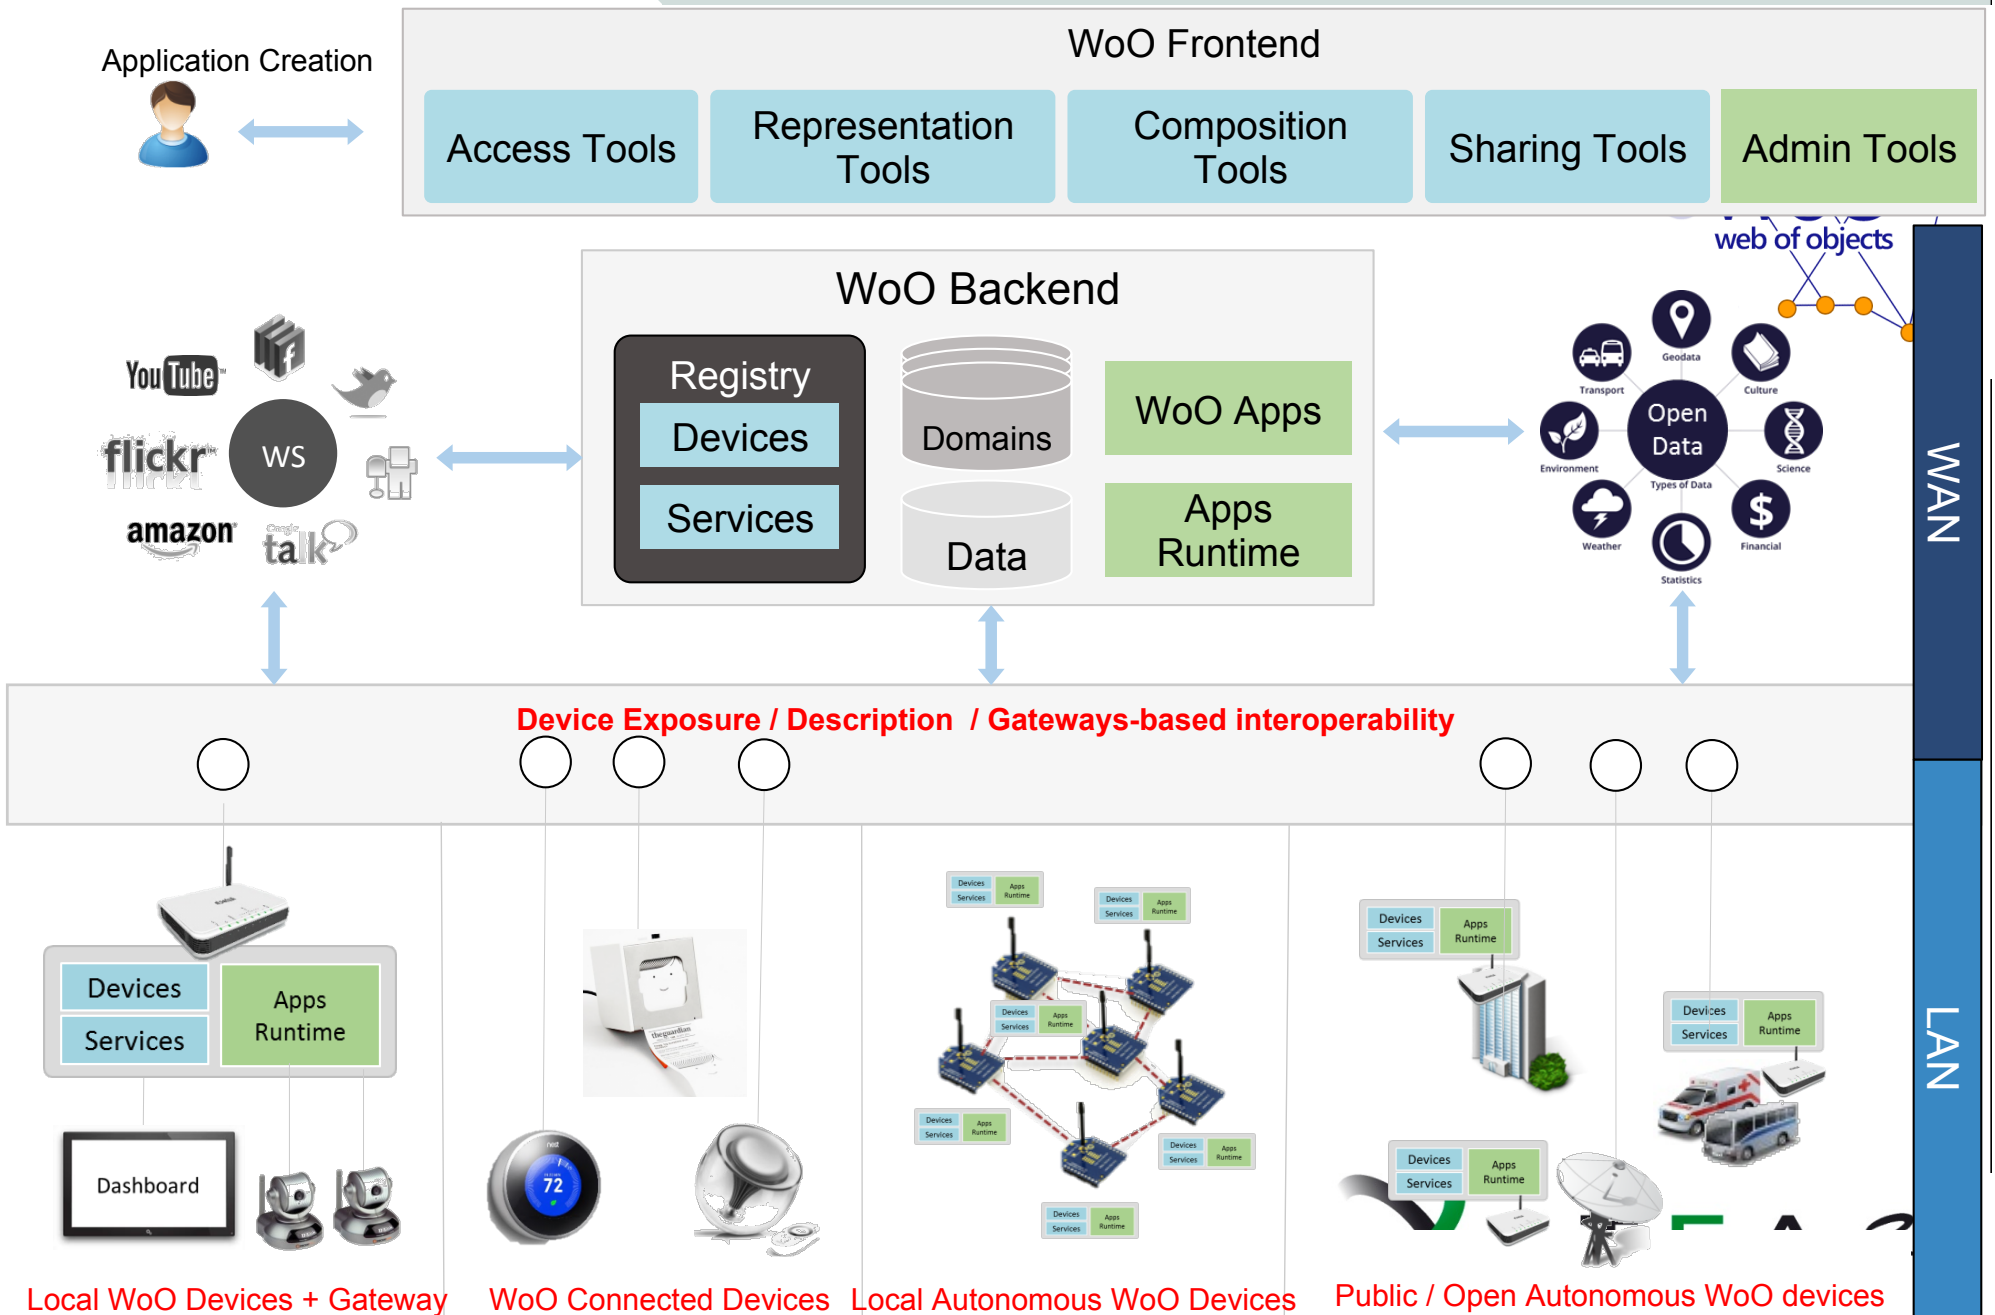

- Semantic annotation tools
- Semantic service orchestration framework

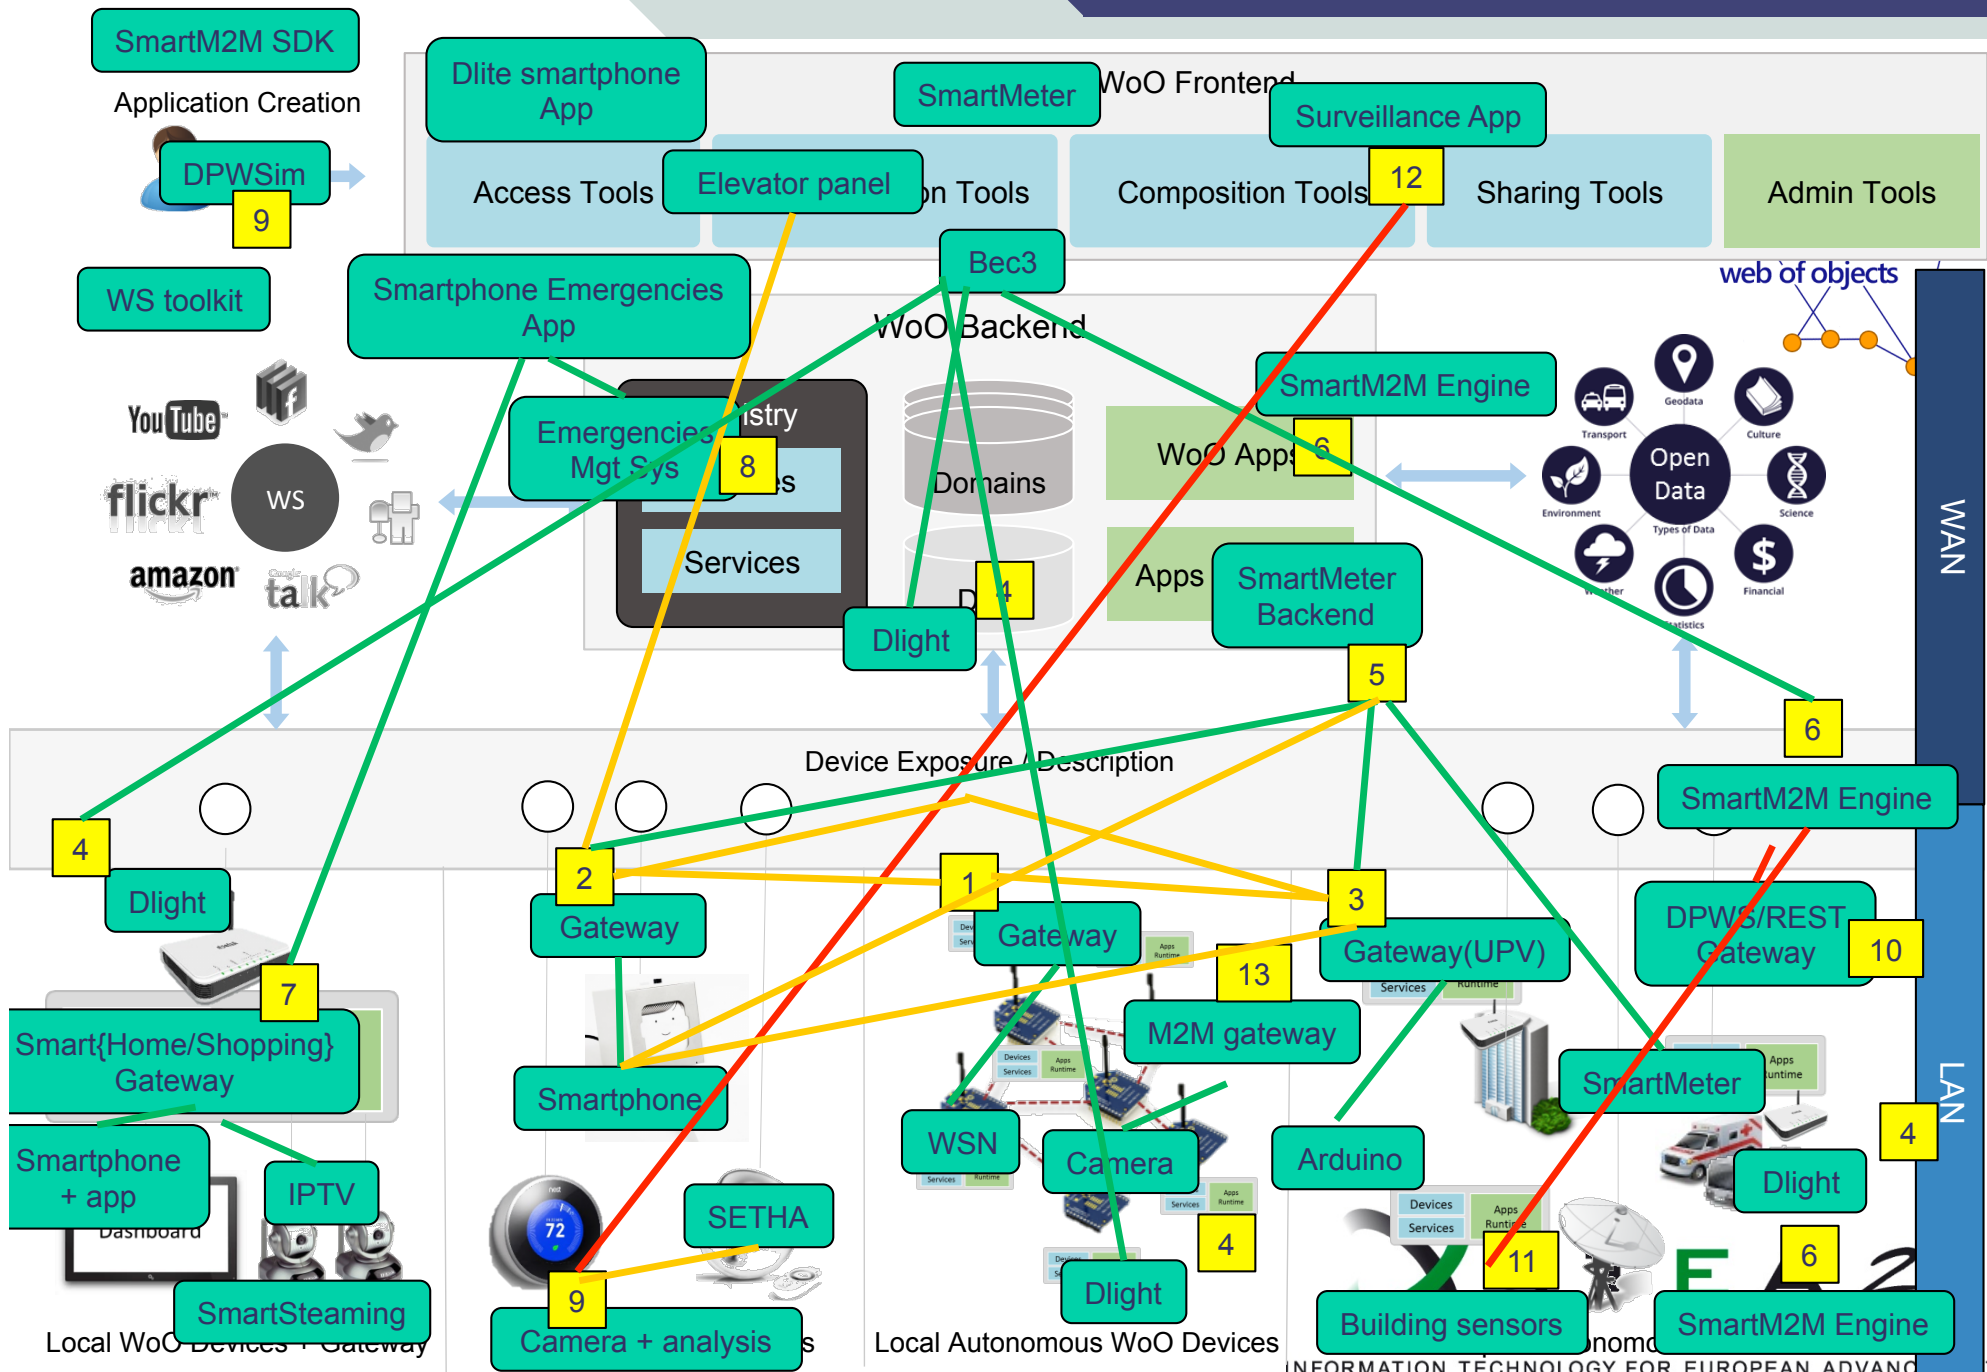

Integrated with different Technologies:

Instantiated in different domains:

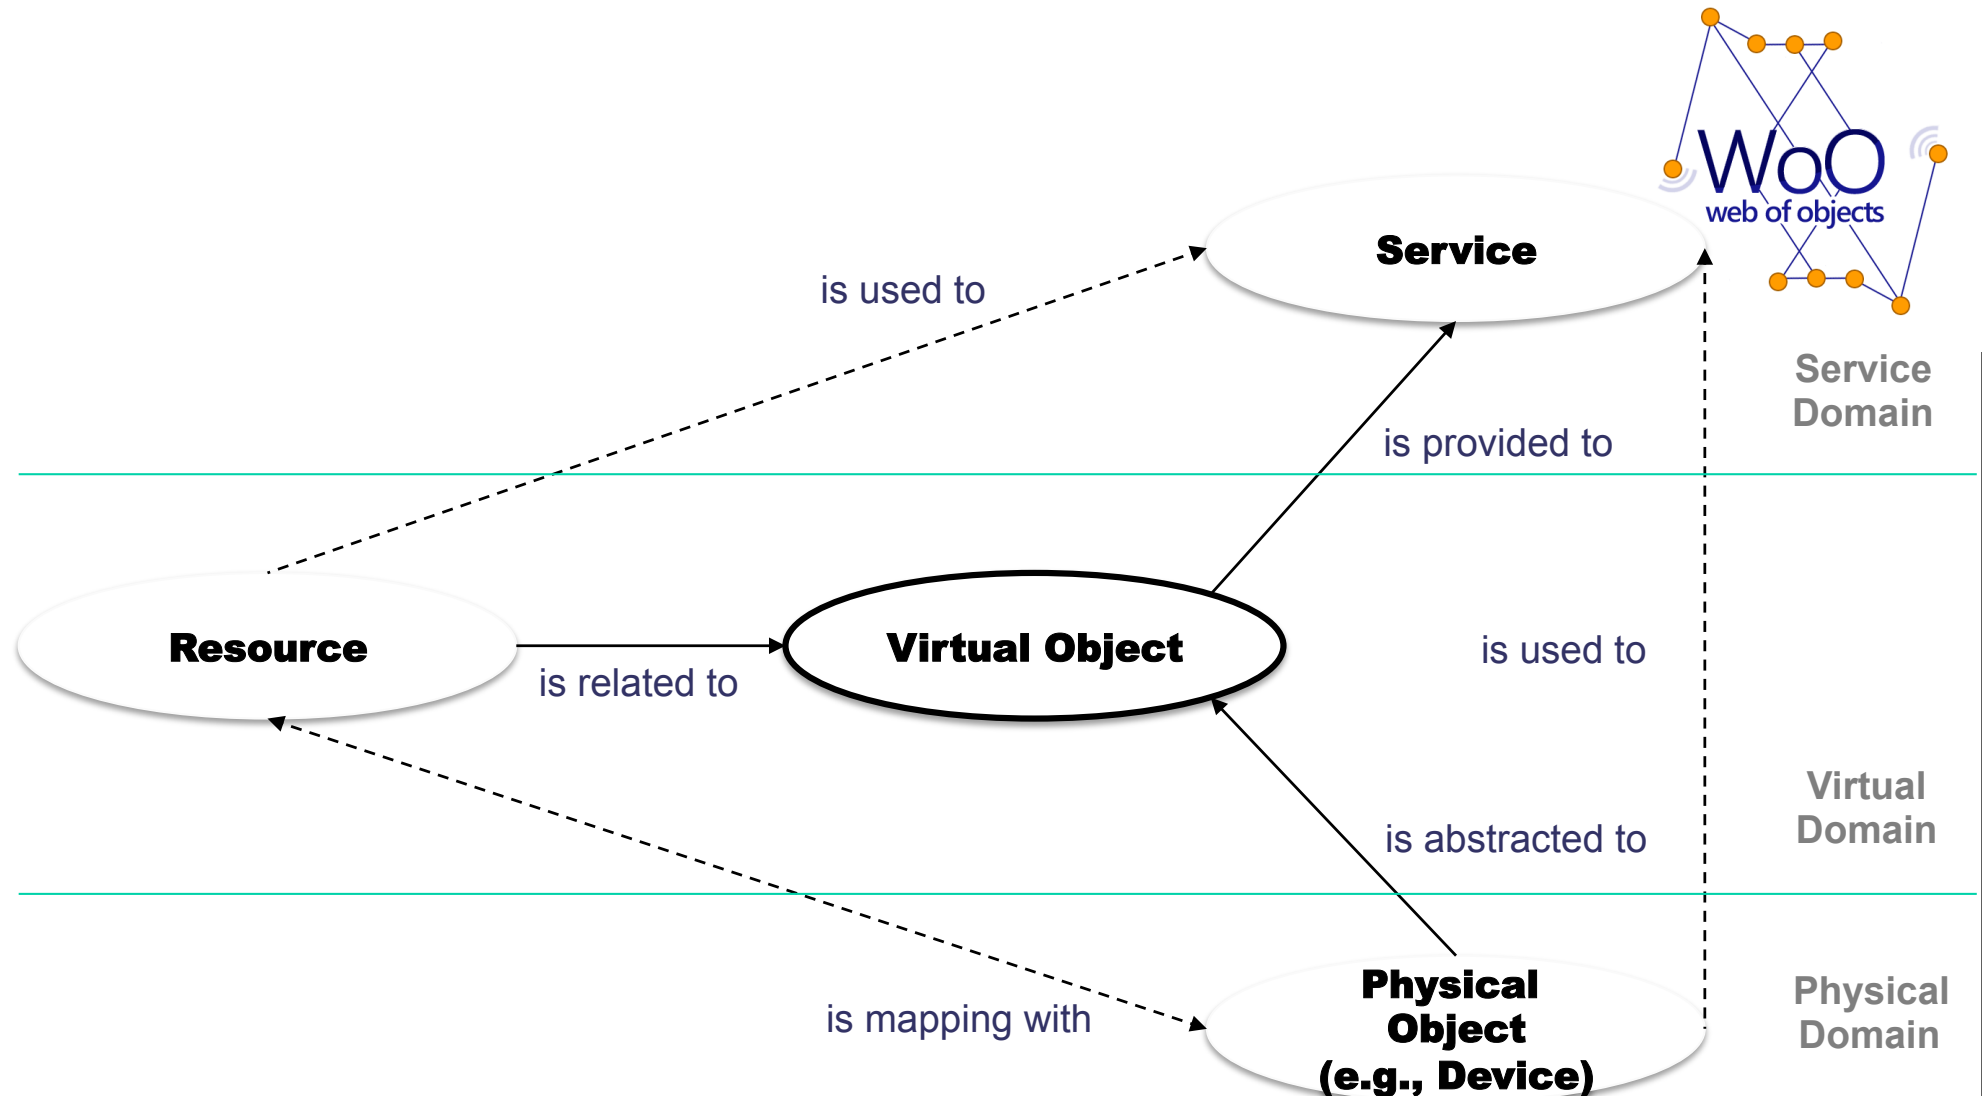

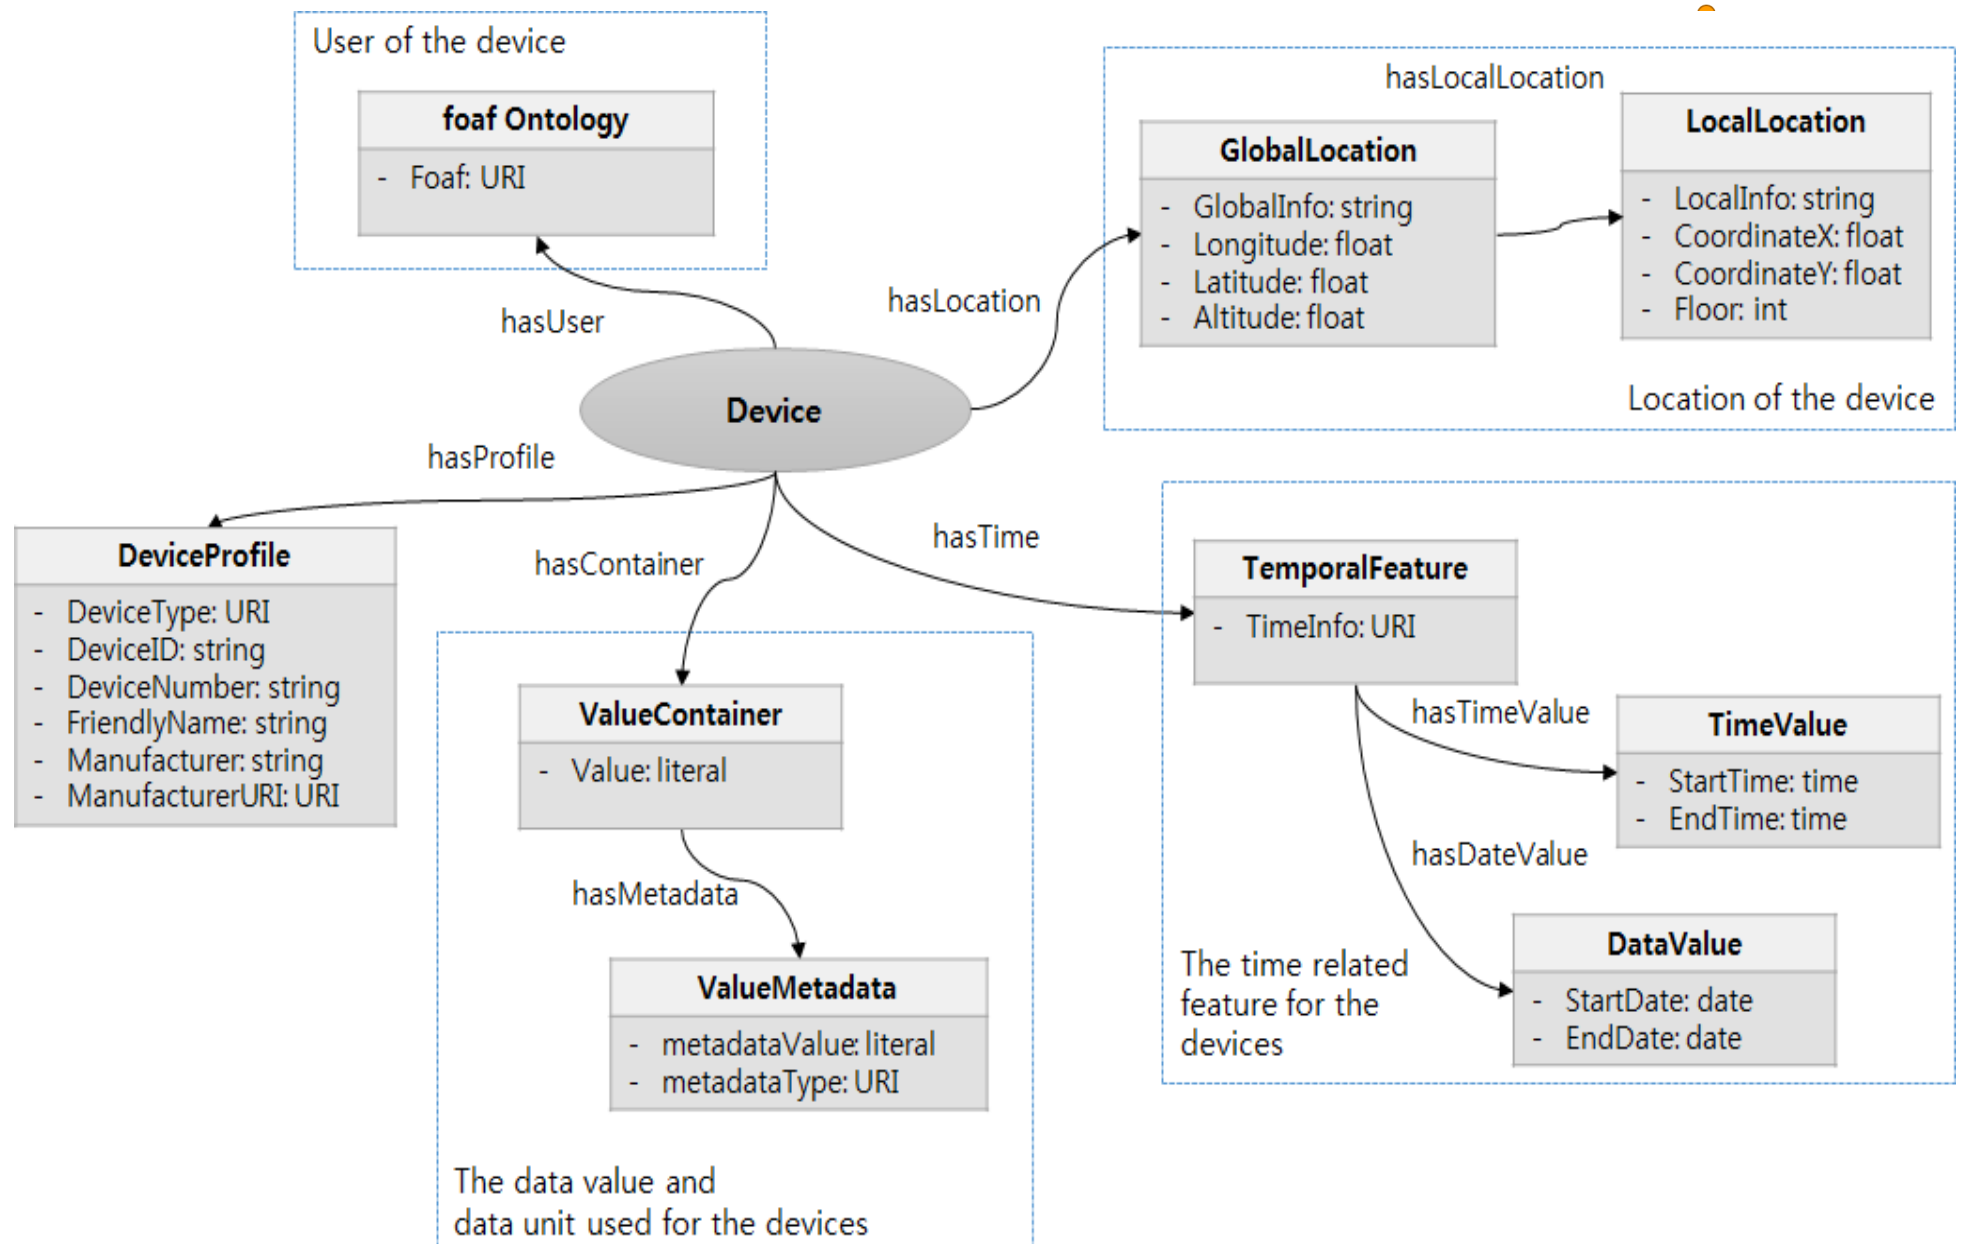

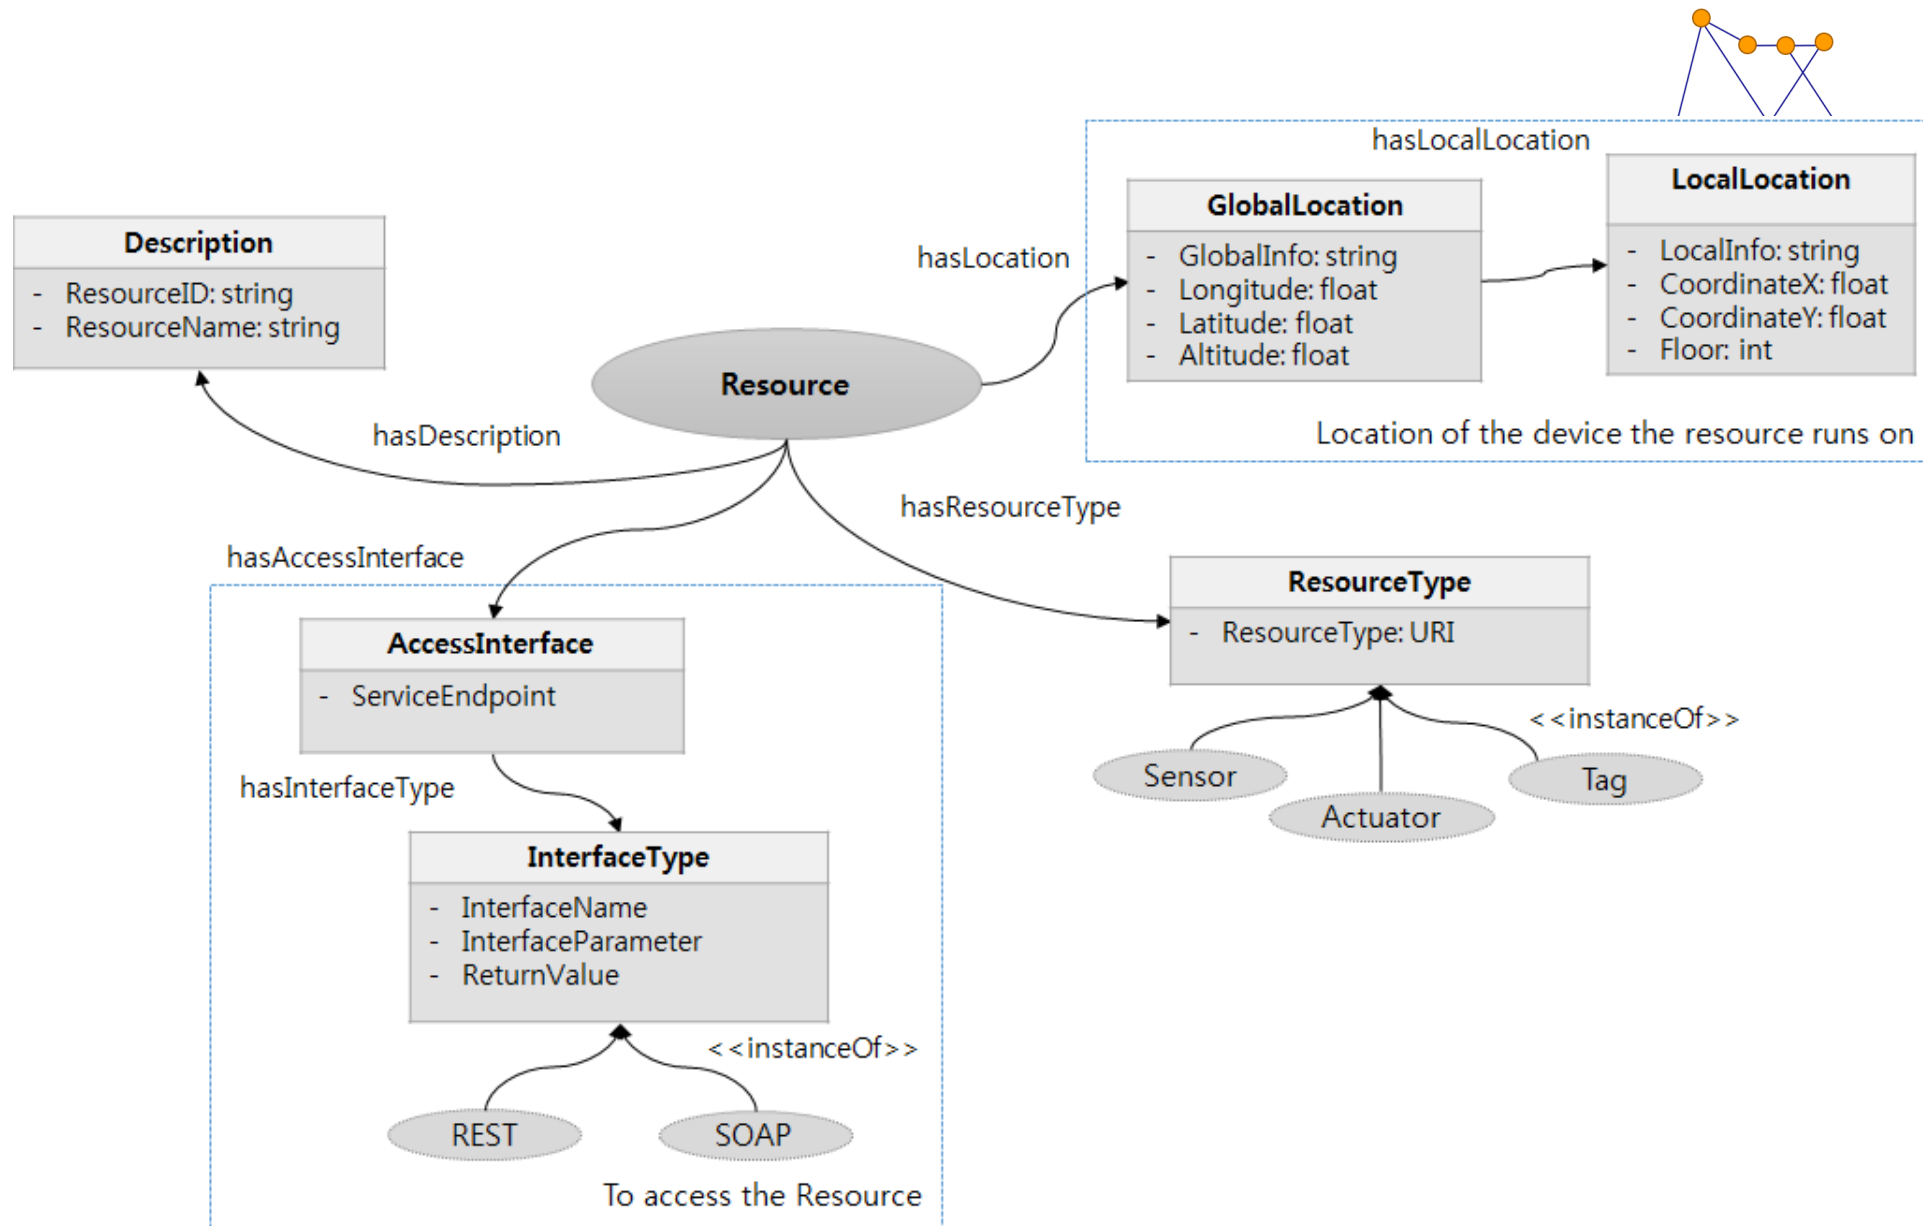

WoO Innovative Approaches

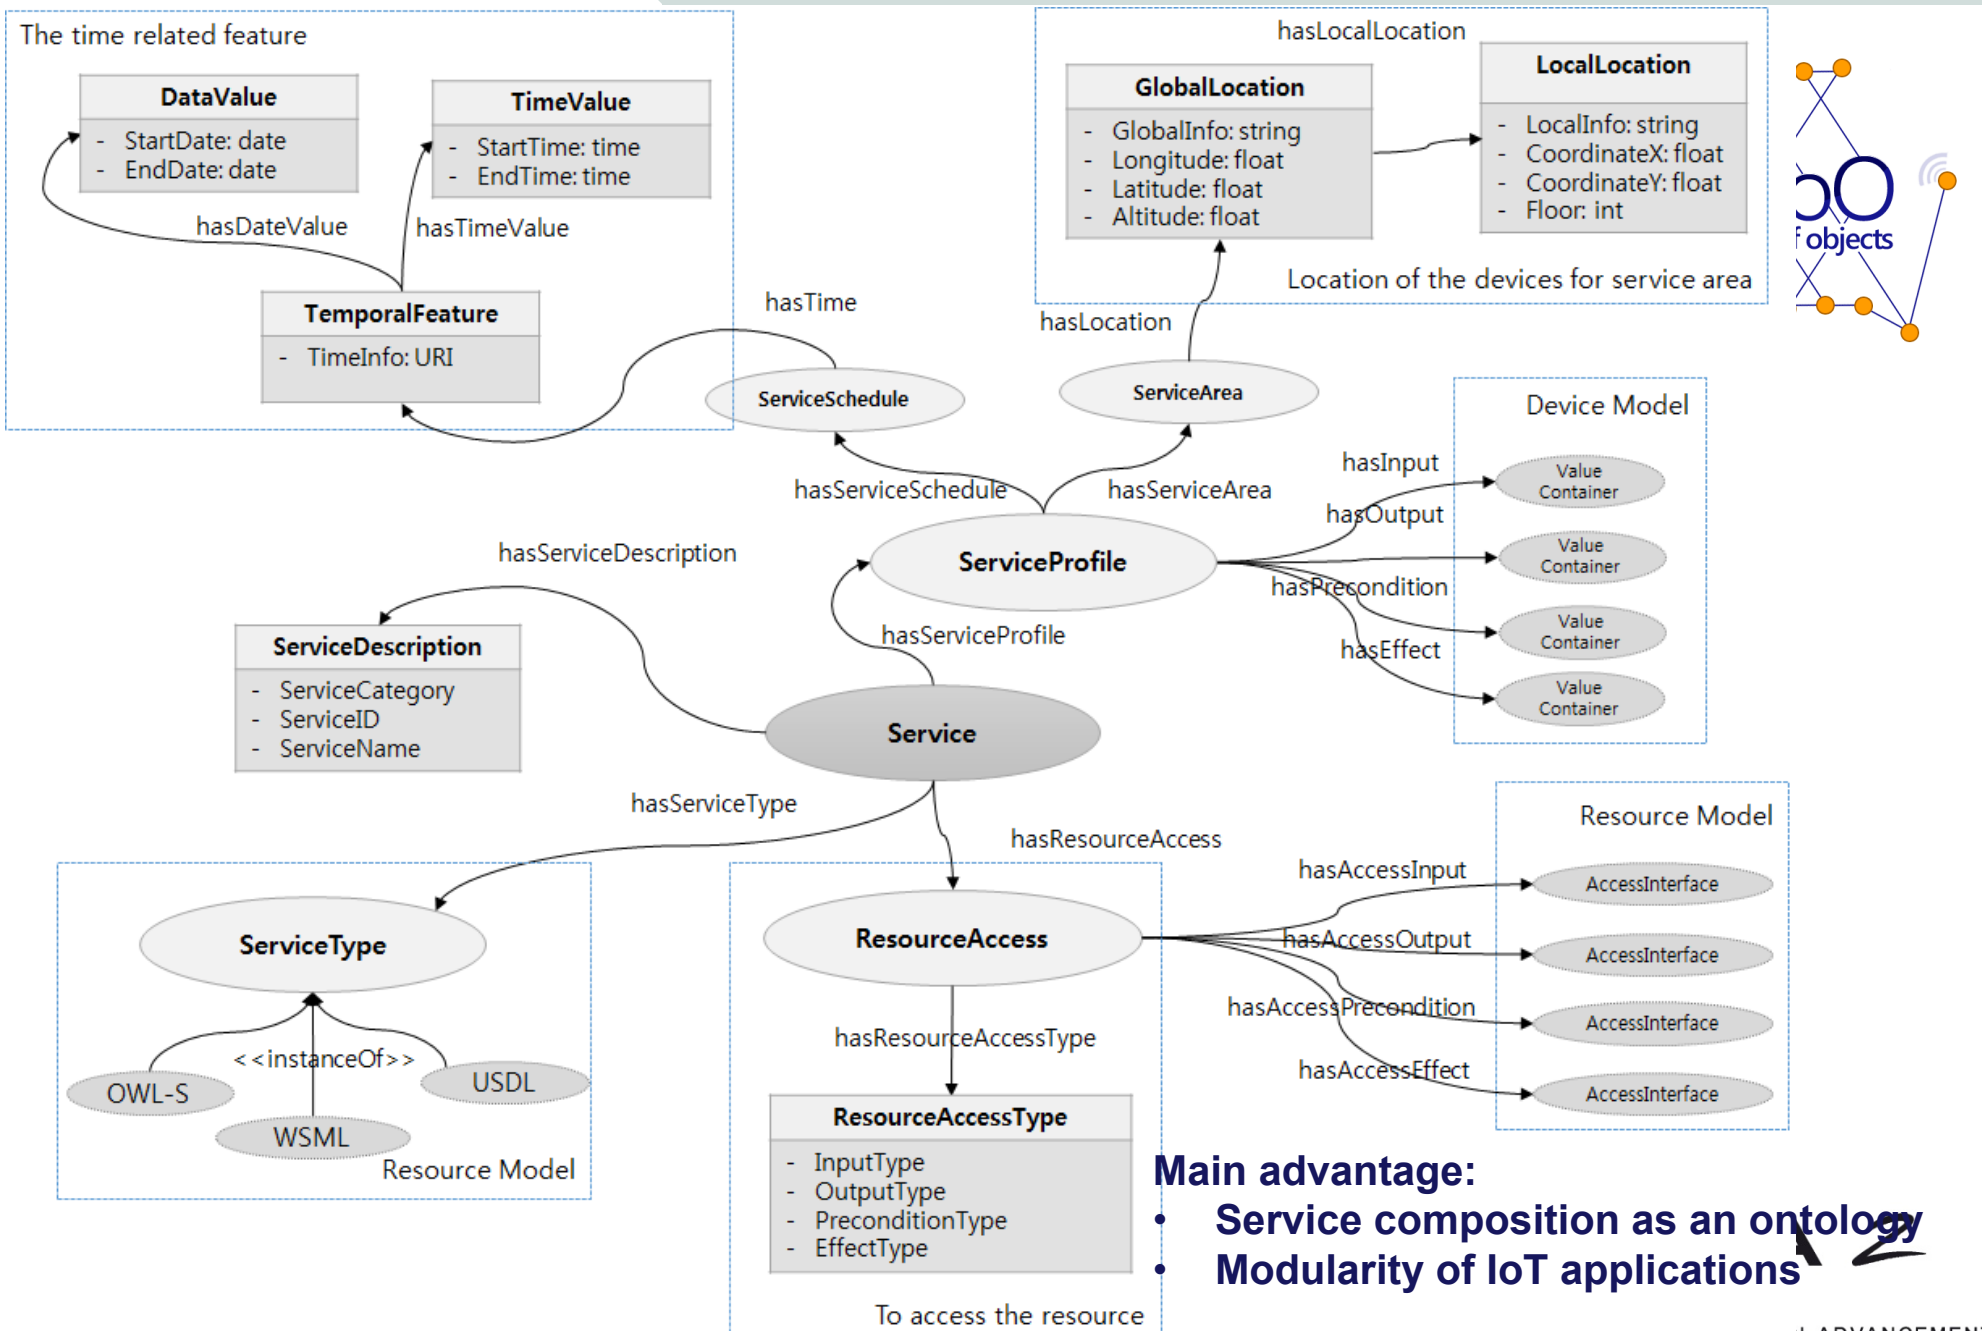

Main advantages:

- Reusing of the objects and their services
- Matching with a cloud computing integration

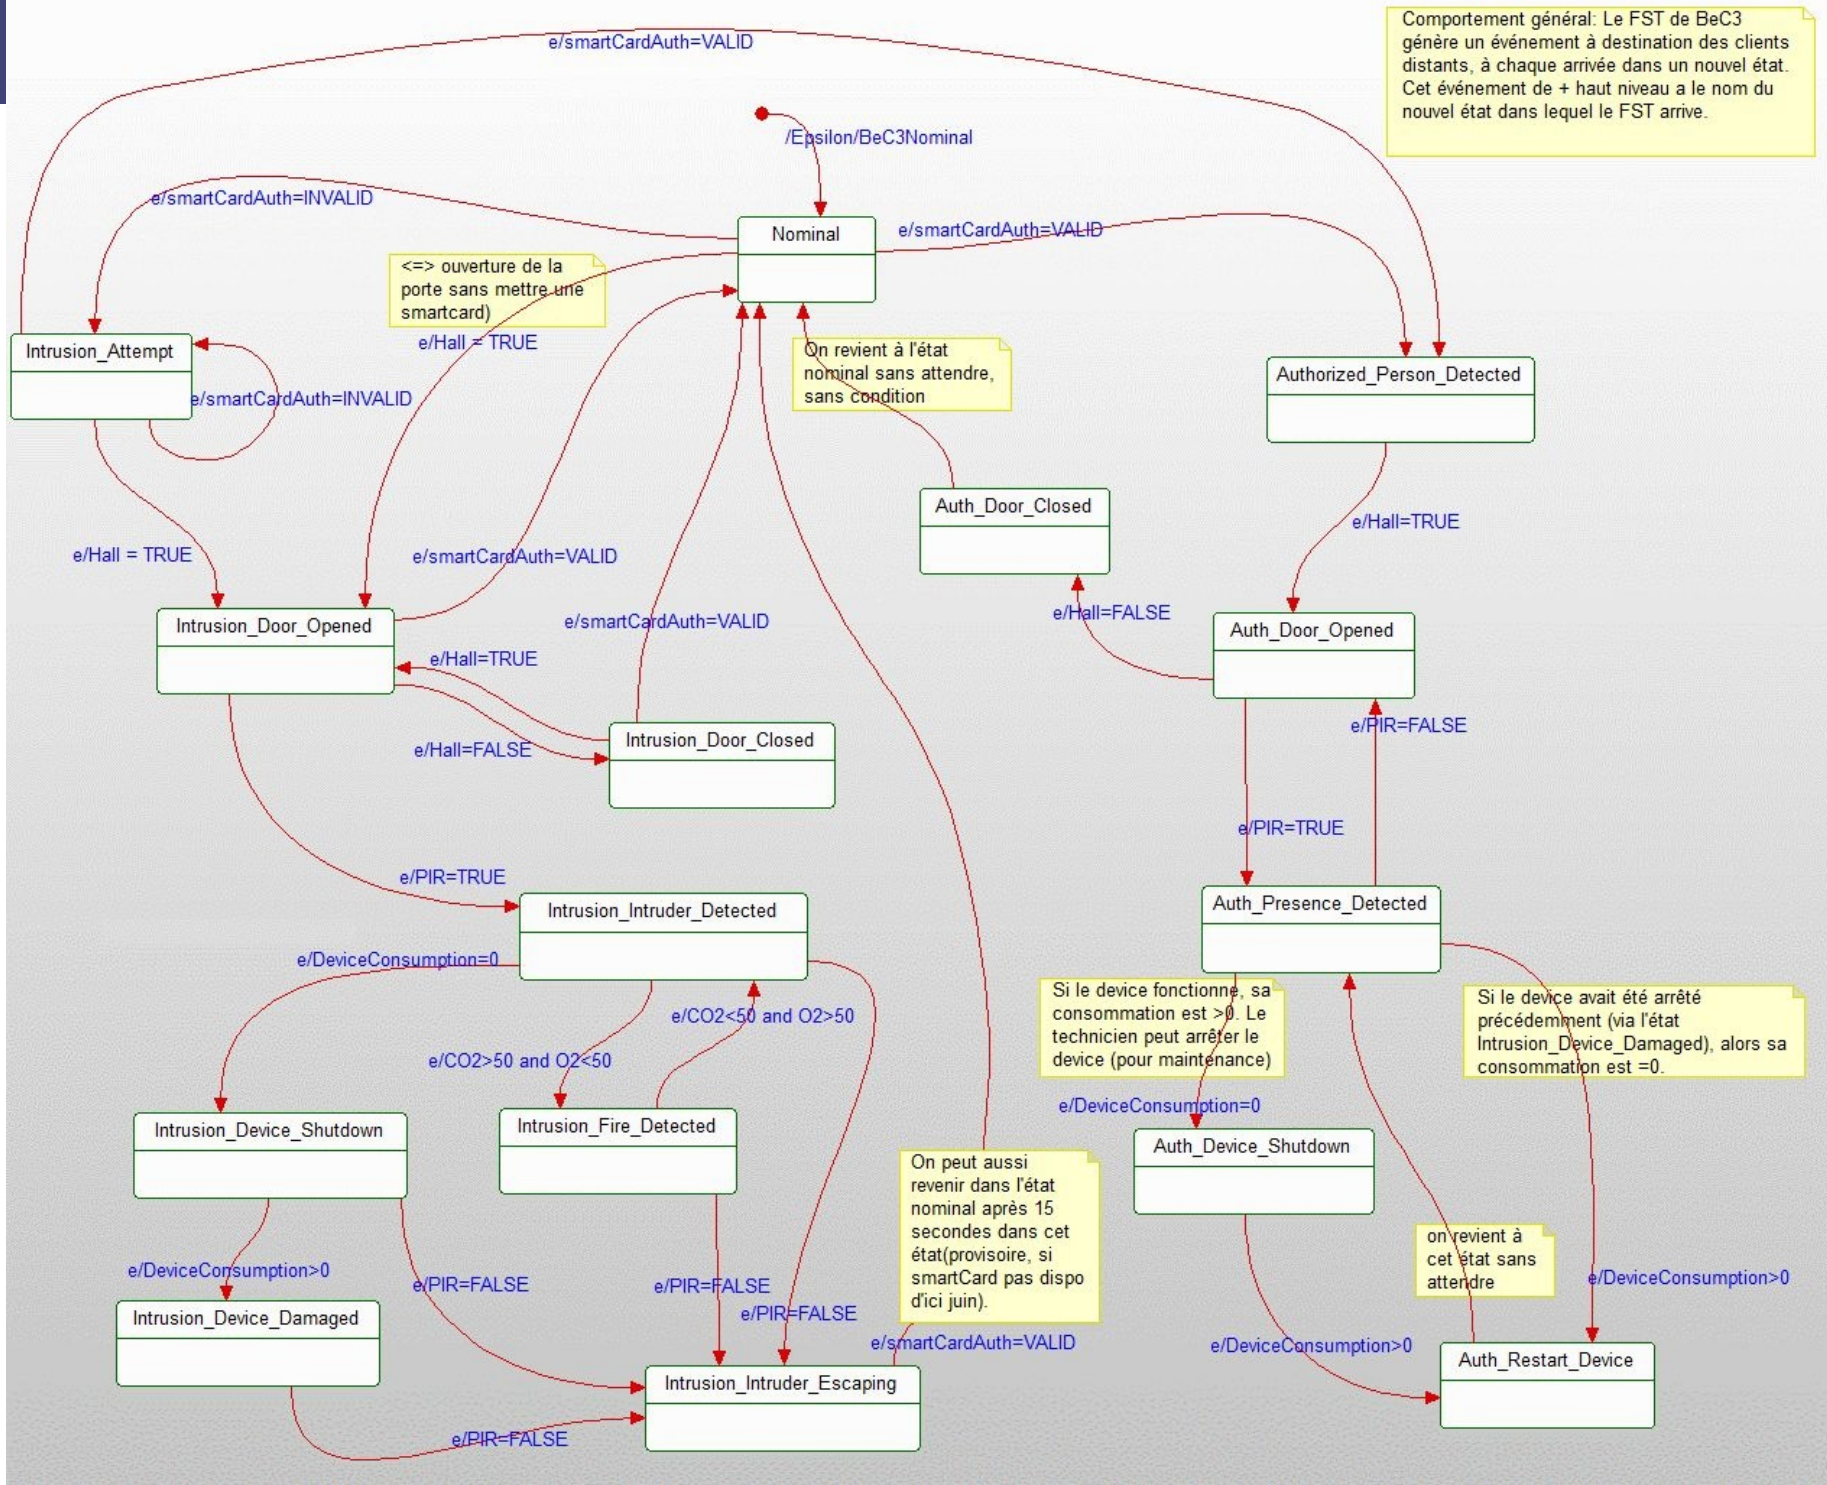

- Main advantage:**
- Service composition as an ontology
 - Modularity of IoT applications

WoO – Business Workflows are employed to define choreographies

DLite API for Your Devices

How does it work ?

Java/Internet Capable Device

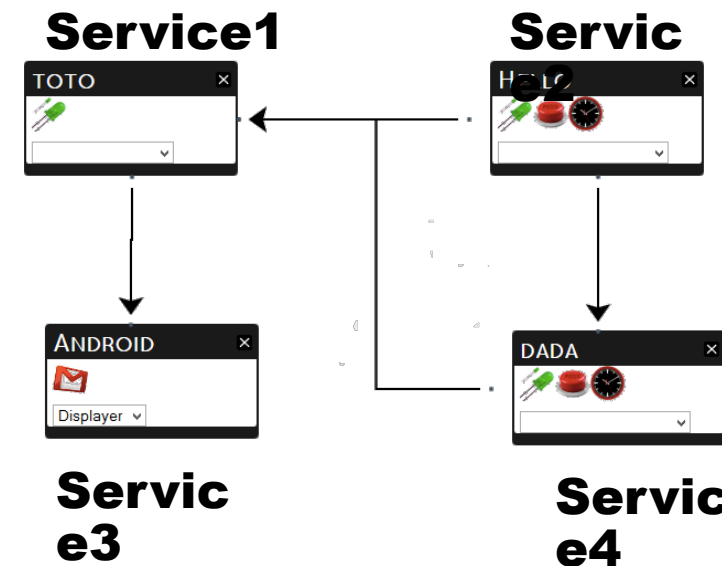

No Java/Internet Device

Java/Internet capable Gateway

DLite API

Abstracted View of Devices on BEC3

Objects interoperability issue

Today connected-objects (sensors, actuators, industrial devices/system) « are talking » amongst themselves (M2M / Internet of Things), but often in different languages.

The number and diversity of communication protocols between these devices are for any industrial system a real Babel tower:

ZigBee	Z-Wave	1-Wire	PLCBUS	KNX
xPL	DMX	DALI	BACnet	6LowPAN
MODBUS	PROFIBUS	CAN	IRDA	WS-*
RFID	NFC	Teleinfo	XBEE	GPRS
GSM	Ethernet	Wifi	TCP/IP	UDP
SNMP	SOAP	HTTP	FTP	SMTP
Bluetooth	RS232	RS485	I2C	USB
REST	and many others...			

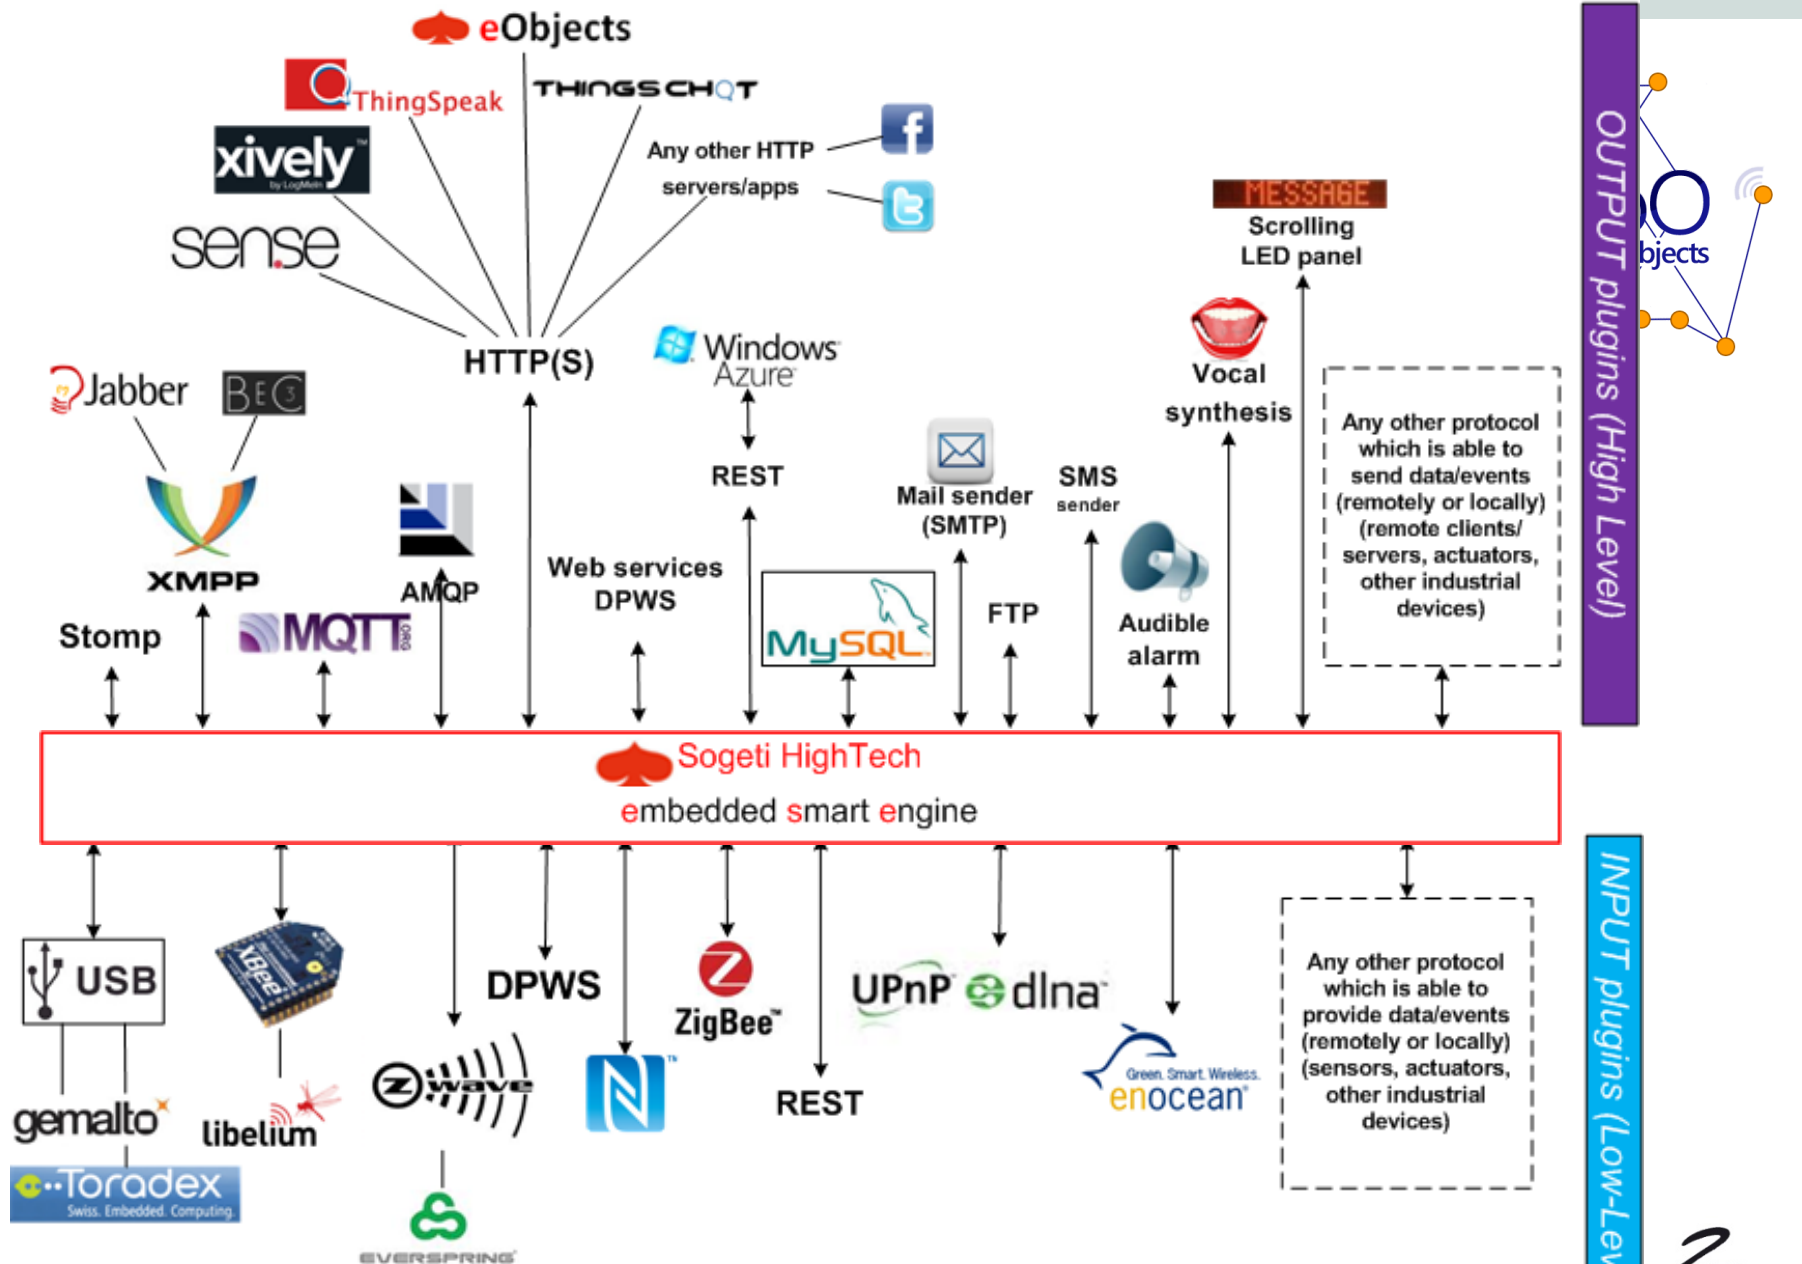

Our clients need a solution to :

➔ Provide communication between heterogeneous devices with or without local/remote management system

➔ Get heterogeneous data and events / Configure devices remotely / Call services.

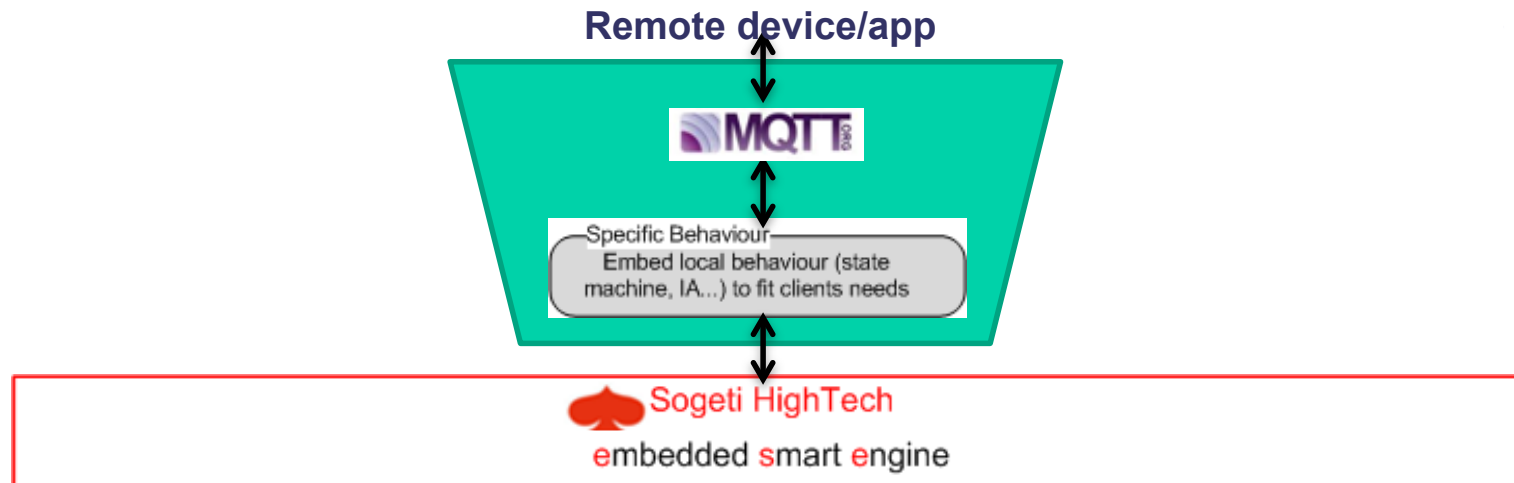

WoO Interoperability: SHT smart engine – Big picture

Connect everything, everywhere, easily.

Adding specific local behavior to plugins

Specific local behavior, specific intelligence, can be added to any input /output plugins.

For example, adding a behavior to take into account data coming from different kind of sensors, and correlate them in real-time to output new higher-level events.

This behavior can be a simple embedded state chart, or a bigger intelligence artificial engine if needed.

This optional behavior, specific to each plug in, allow the implementation any kind of scenarios and business cases.

Exposing a device on the Internet increase its security vulnerability:

- ◆ Hacking IoT devices is a trend in security conferences
- ◆ a Mozilla software developer demonstrated how to gain access to hotel rooms protected by key card locks made by Onity
- ◆ As for computers, new worms are able to infect home routers, set-top boxes, security cameras, and other consumer devices
- ◆ Real life incidents:
 - web-based **vehicle-immobilization system** disabled more than 100 vehicles in Austin (Texas);
 - a hacker gained access to a **baby monitor**;

WoO efforts towards increased WoT security (semantic-based approach):

- ◆ Considering all security parameters
- ◆ Ensuring security at multiple levels
- ◆ Deploying multiple security mechanisms

Contributions of WoO

- ◆ **Context management and security policies**
 - Decentralized management of the user's profile
 - Different view of the profile according to the current context
 - Group management and key distribution
- ◆ **Privacy of the user's profile**
 - Hiding sensitive information
 - Distortion of the user's profile
- ◆ **Accessing services**
 - Traditional security: object authentication, user authorization
 - New secure services: oblivious databases
- ◆ **Recommending objects, services and content**
 - Search for content and objects w/o leaking preferences

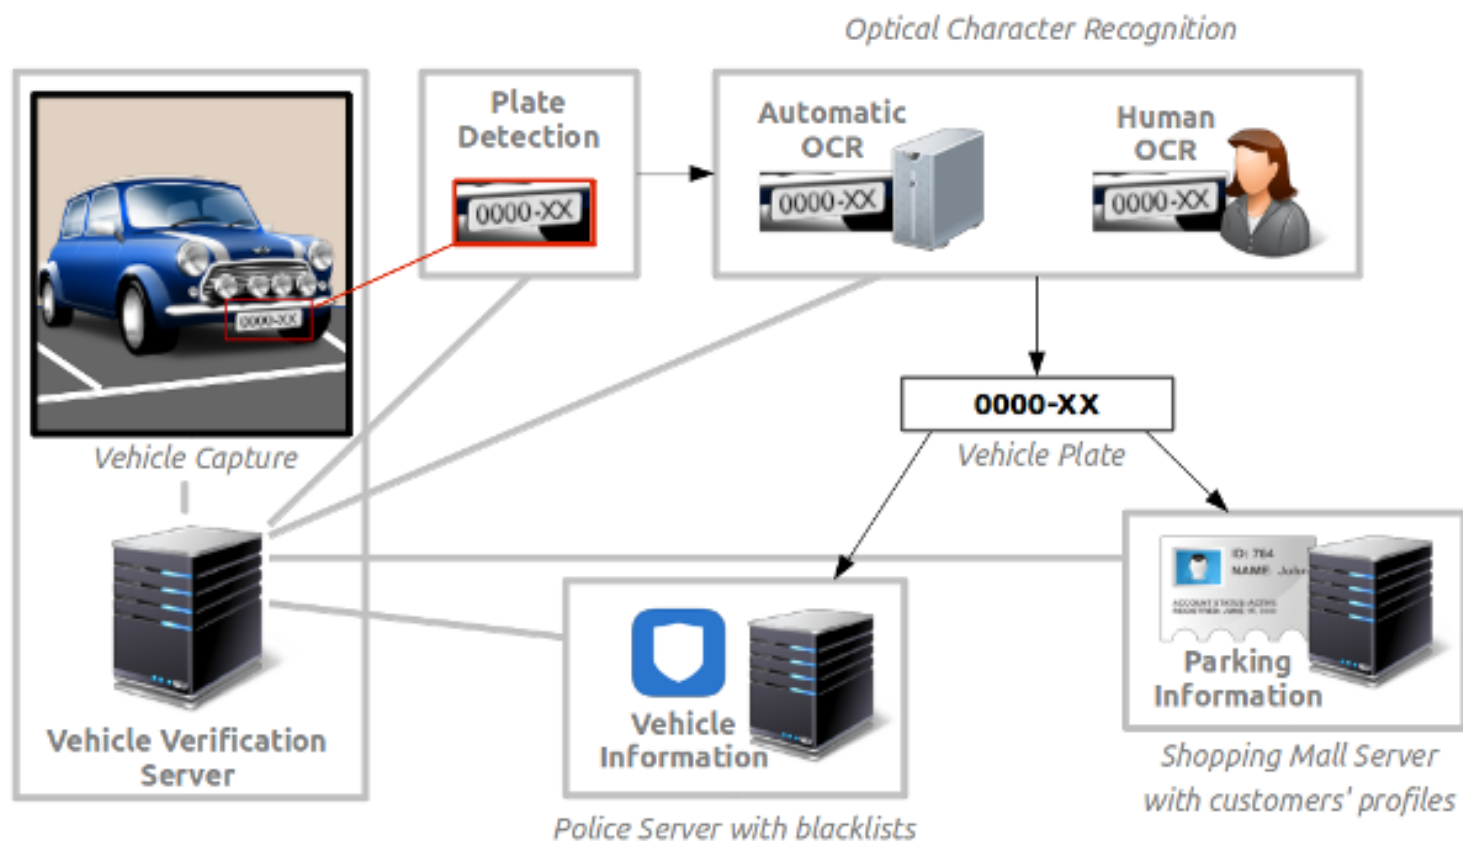

Step in the WoO demonstrator

◆ Private authorization of location-based services

- Demonstrates the use of homomorphic encryption to provide oblivious databases

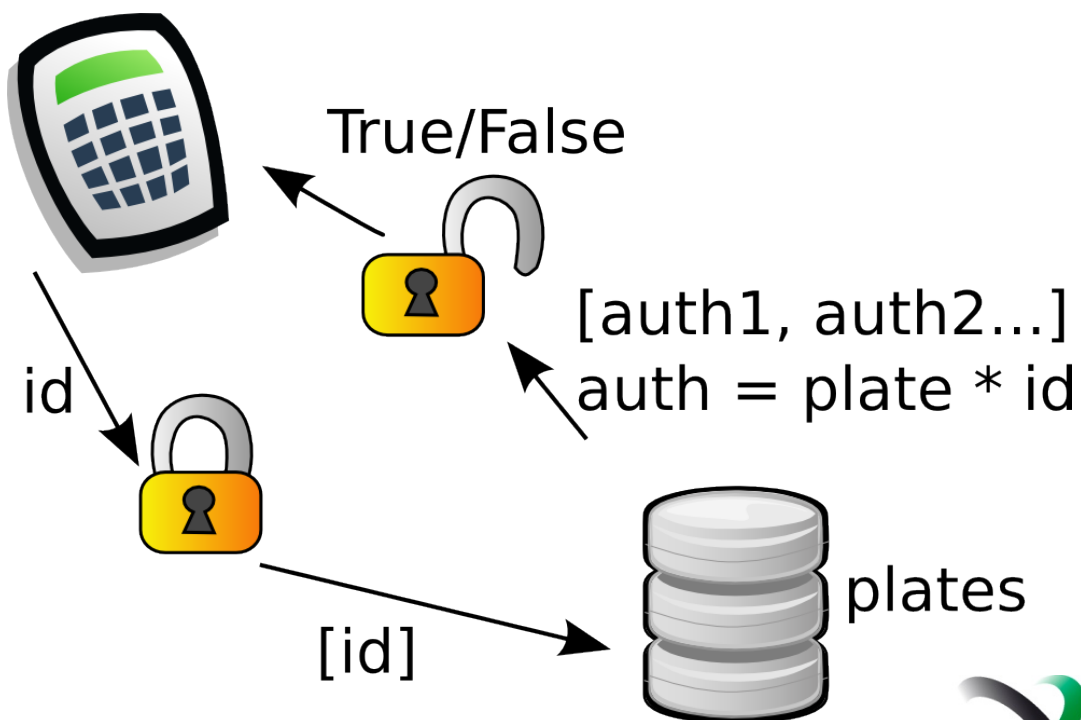

Step in the WoO demonstrator

◆ Private authorization of location-based services

- Demonstrates the use of homomorphic encryption to provide oblivious databases

Step in the WoO demonstrator

◆ Secure recommendations and privacy protection

- Demonstrates the use of profile distortion to protect the user privacy

Step in the WoO demonstrator

◆ Secure recommendations and privacy protection

- Demonstrates the use of profile distortion to protect the user privacy

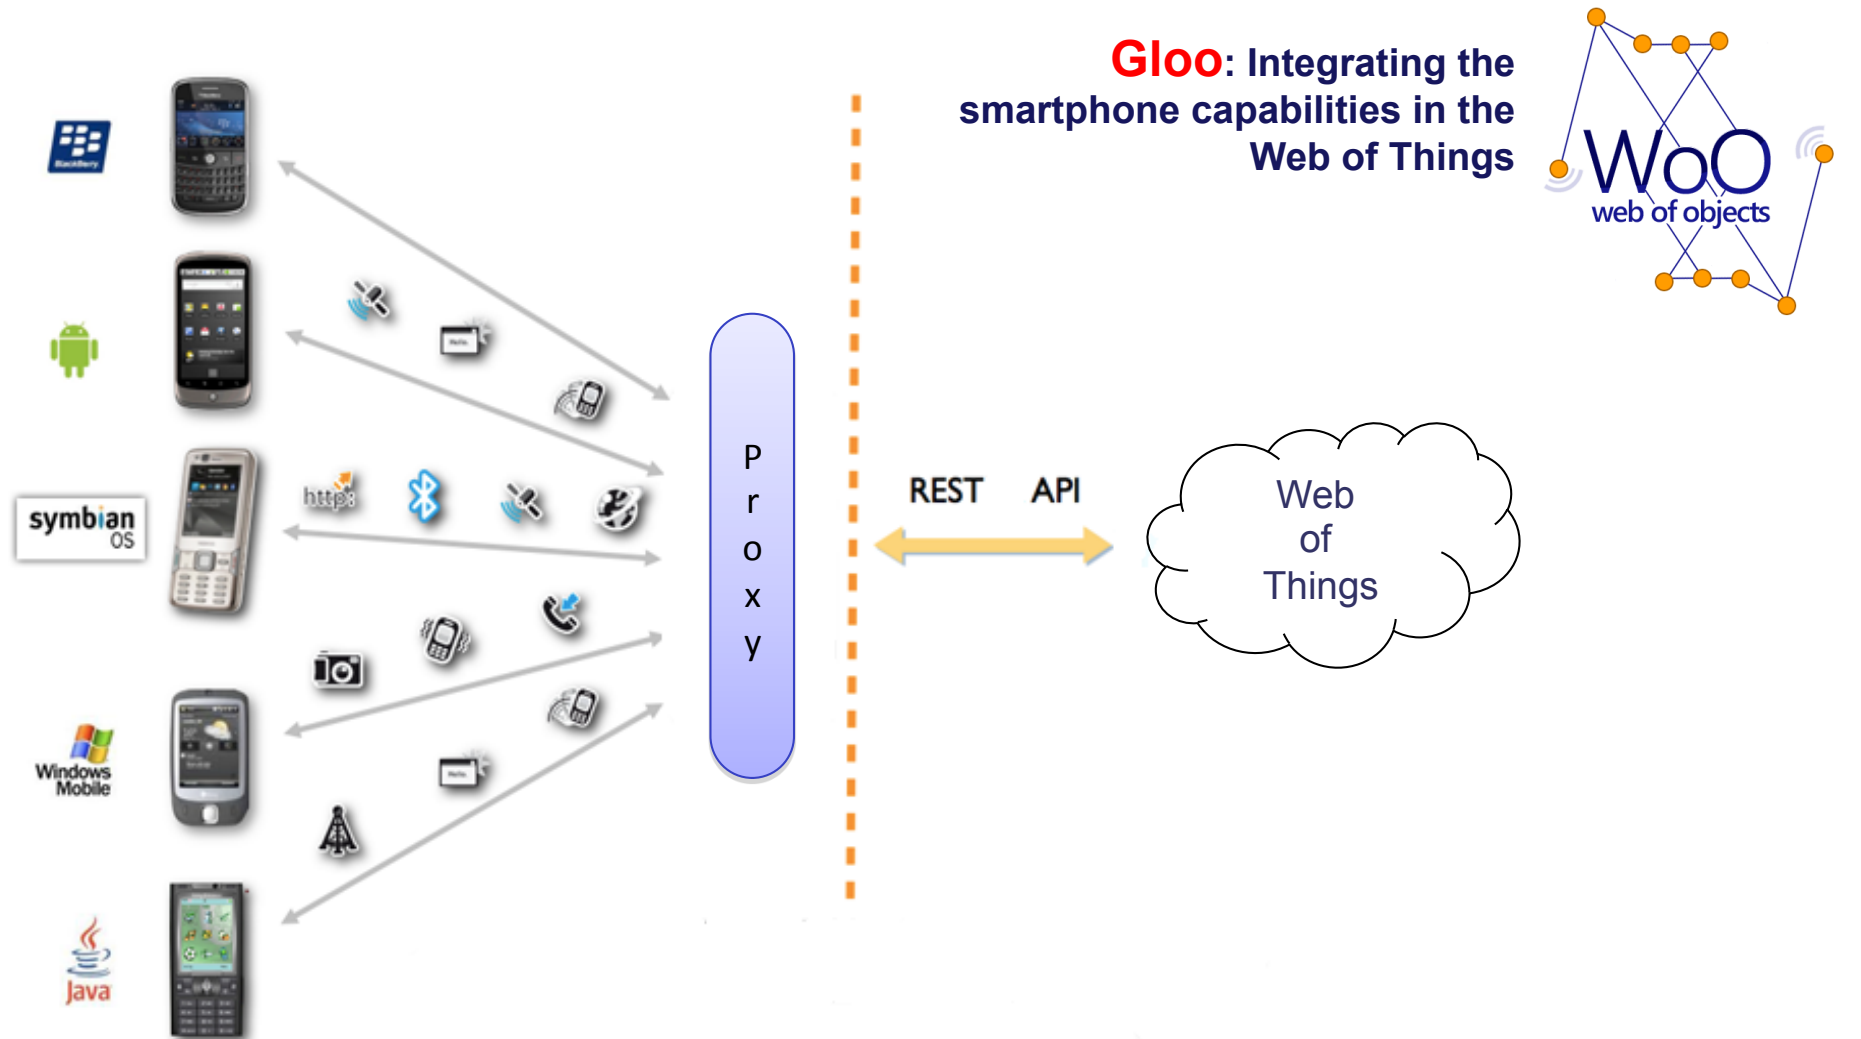

WoO Project Enablers

**The smartphone:
A device full of sensors, actuators and capabilities**

ITEA 2

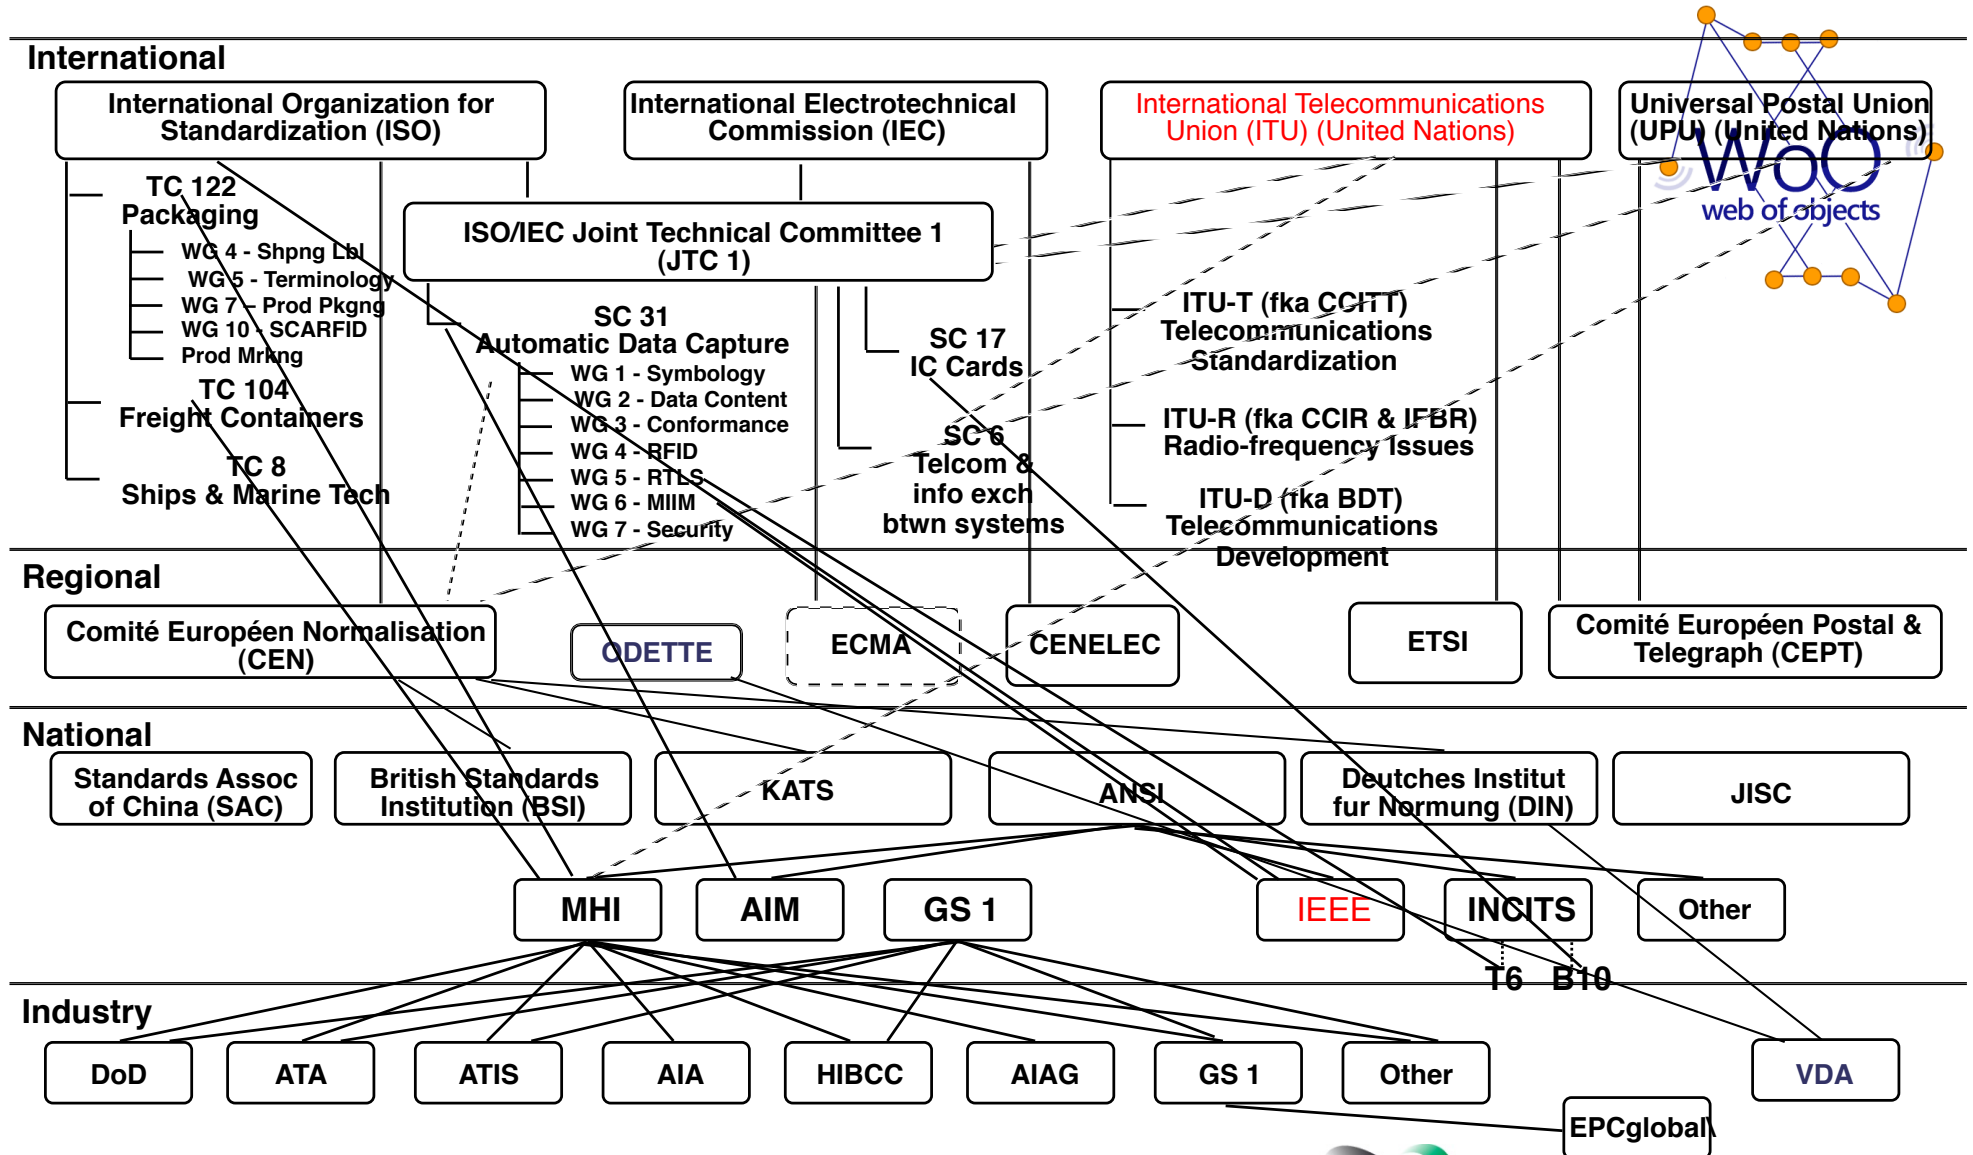

GLOO current Capabilities:

- ◆ Accelerometer
- ◆ A/GPS
- ◆ Bluetooth (near devices)
- ◆ Tower Cell
- ◆ Camera
- ◆ Browser
- ◆ NFC
- ◆ Phone call
- ◆ Contacts
- ◆ Messages and Polls (Human interaction)
- ◆ User Profile

IoT - International Standards Activities picture

◆ 2012: 12 contributions to different standardization bodies:

◆ 2013: 16 contributions to different standardization bodies:

- ITU-T SG13: Future networks including cloud computing, mobile and next-generation networks

Published Recommendations

- ◆ **Y.2060**: Overview of the Internet of things
- ◆ **Y.2061**: Requirements for the support of machine-oriented communication applications in the next generation network environment
- ◆ **Y.2062**: Framework of object-to-object communication for ubiquitous networking in next generation networks
- ◆ **Y.2063**: Framework of the Web of Things
- ◆ **Y.2064**: Energy saving using smart objects in home networks
- ◆ **Y.2069**: Terms and definitions the Internet of Things

On-going draft recommendations

- ◆ **Y.sfem-WoO** (energy management – Web of Objects)
- ◆ **Y.sms-WoO** (smart media services – Web of Objects)
- ◆ **Y.social-device** (social device networking)

WoO Conclusions

Semantics

- ◆ Enables a device to be **accessible** and **act as actor** in multiple applications (government, police, fire agency, hospitals, shops)

Service composition

- ◆ Enable to define complex service workflows for complex business applications

Interoperability

- ◆ Enable devices based on heterogeneous communication protocols to be part of complex applications

Security

- ◆ Enable to filter the device exposure to Internet for avoiding the security vulnerability

Better exploiting the Smartphone Sensors

- ◆ Gloo platform: Integrating the smartphone capabilities in the Web of Things

Standardization efforts

- ◆ IoT solution can be adopted by Business world if based on standards

Further Steps towards finalizing the WoO solution:

- ◆ Standardization of the proposed framework for the IoT for **making an business IoT solution as modular as possible**
- ◆ Validating the solution through all the project demonstrators

Further collaboration perspective

- ◆ object virtualization : integrating semantic approach with the cloud computing technologies
